# Gender, Sibship Size and Unpaid Care Work:

## Assessing Heterogeneous Treatment Effects of a Cash Transfer for Education on School Progression

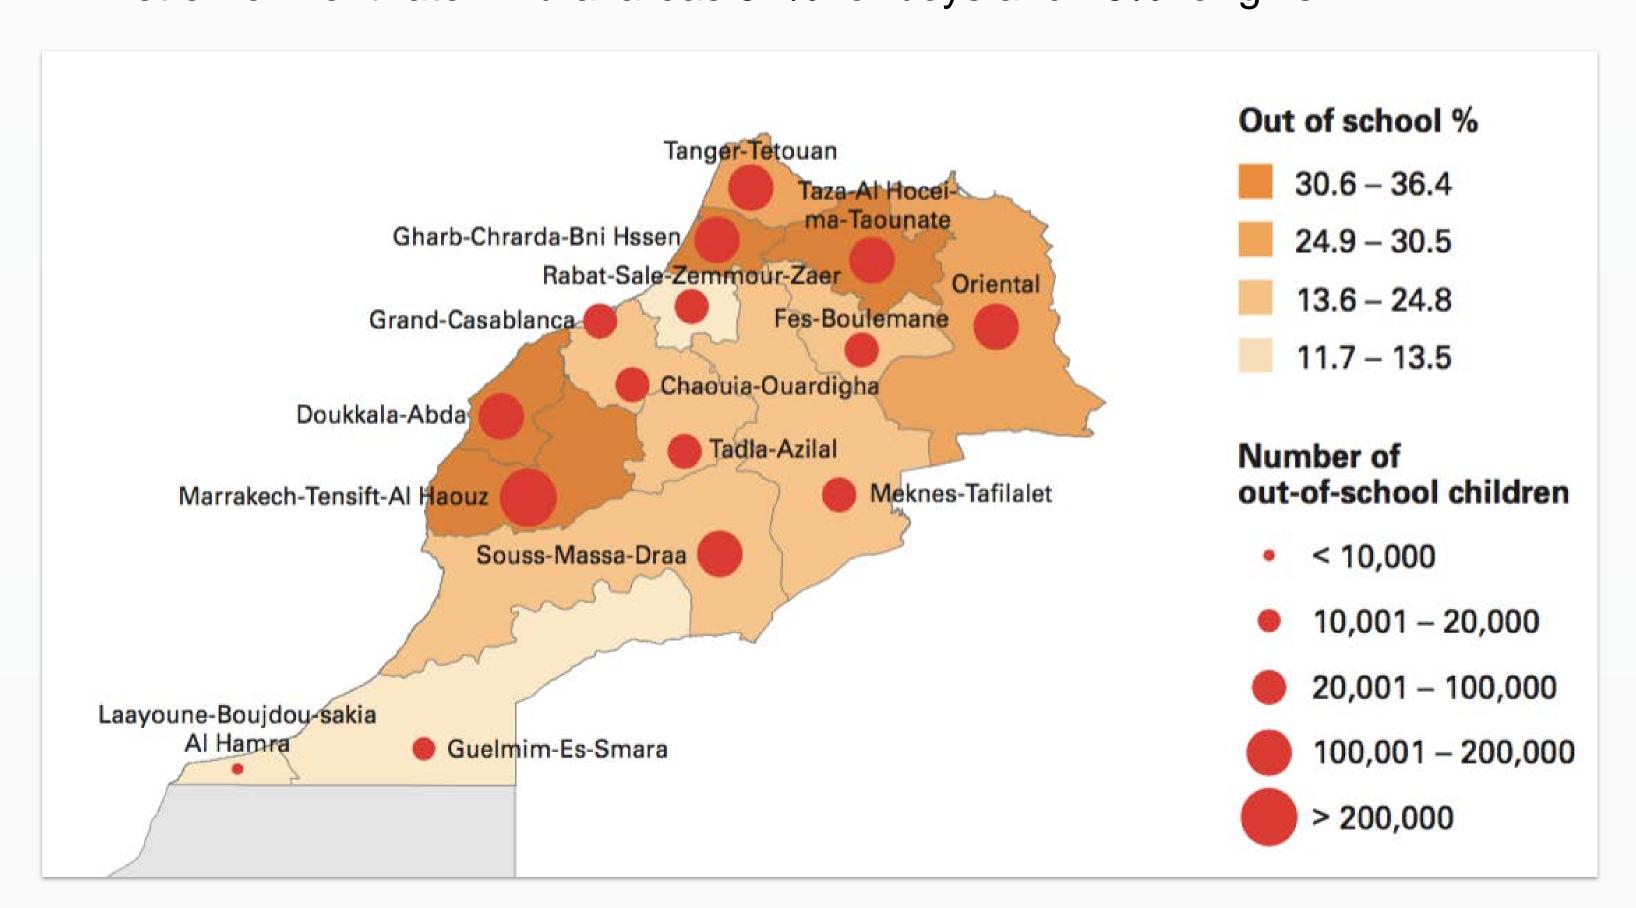

Luca Maria Pesando,

Population Studies Center, University of Pennsylvania

#### Context

Morocco: lower middle-income country with GDP per capita of 5,500\$ (PPP) in 2014 Stark rural-urban and gender differences (DHS 2003)

- Out of school at secondary school age: 24% in urban areas and 63% in rural
- ❖ Net enrollment rate in rural areas 52% for boys and 26% for girls

#### Intervention

Morocco's Ministry of Education cluster-randomized control trial entitled "Tayssir"

Aim: To increase rural primary school completion rate with a cash transfer (~ 5% avg HH monthly consumption) given to HH with children 6-15

- All HH with eligible children in targeted communities
- Poorest communities in the 5 poorest regions
- Randomization at the school-sector level
- 320 school-sectors with at least 2 communities each
- Four treatment arms defined by:
  - Mother vs. father as transfer recipient
  - Unconditional vs. conditional transfer

### **Previous Findings**

Benhassine et al. (2015) – AEJ: Economic Policy

- ❖ Positive and significant impact on school enrollment and school attendance
- Positive but non-significant effect on test scores
- Unconditional ("labeled") variant more effective than the conditional

#### Contribution

- 1. Assess whether a cash transfer program linked to education influences time spent on unpaid care work (UCW) within the household
- 2. Assess whether such a program influences grade progression through school on top of enrollment and attendance
- 3. Assess whether the impacts of the program on grade progression are moderated by time spent on unpaid care work in the house prior to intervention implementation

#### Data

Publicly available secondary data from the World Bank/JPAL platform

Household surveys

- ❖ Baseline: 2008
- ❖ Endline: 2010

Children as main units of analysis:

- ❖ 10,889 children 6-15 at baseline
- ❖ 951 children (8.73% of baseline sample) dropping out in between
- ❖ Post-attrition sample: 9,938 children

Attrition is higher among control units and boys

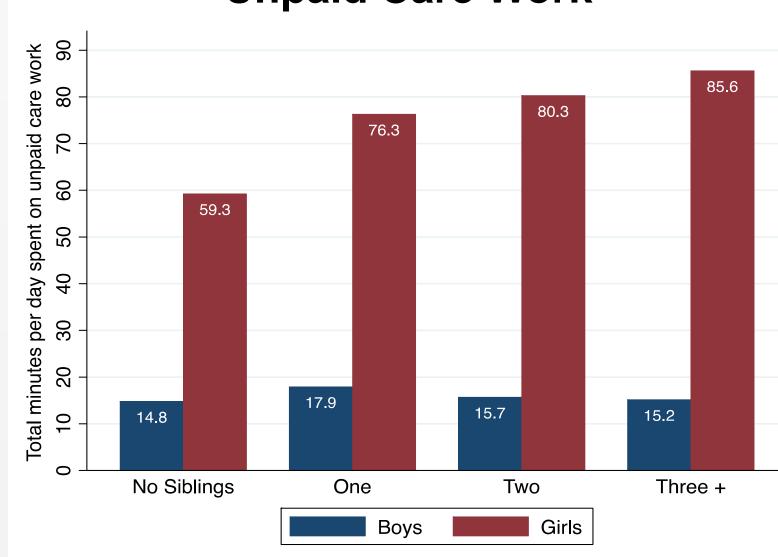

#### Methodology

- . Difference-in-Differences OLS regression for time spent on unpaid care work
- 2. Ordered logistic and linear probability models (LPM) for school progression outcomes
- 3. (Treatment\*baseline moderator) interaction terms to assess variation in program impact

### Descriptives

- Unpaid care work built through time-use diary reporting primary and secondary activity each 30-min
- Estimate of **minutes per day** spent on unpaid care work (sum of 10 activities)
- 21% of boys performing any UCW vs 52% of girls
- Female-to-male ratio highest (17:1) for housework and washing clothes

## **Unpaid Care Work**

#### Results

#### (1) Unpaid Care Work (Diff-in-Diff)

|                    | Boys      |           |           |           | Girls     |            |  |  |

Time spent on unpaid care work:

- increases overtime for girls but not for boys
- increases with number of siblings for girls only
- does not change as a result of the treatment

#### (2) School Progression Outcomes

#### A. Continued Enrollment/Progression (Ordered Logit)

|                              | Boys    |         |          |          | Girls    |          |  |  |
|------------------------------|---------|---------|----------|----------|----------|----------|--|--|
|                              | (1)     | (2)     | (3)      | (1)      | (2)      | (3)      |  |  |

| N                            | 3,925    | 3,780    | 3,780    | 3,241    | 3,104     | 3,104    |  |

#### Results continued

#### (3) Moderation by Baseline **Unpaid Care Work**

Though the treatment reduces dropout equally for children doing vs. not doing unpaid care work, there is a differential treatment effect on grade progression for girls.

## Findings

- Cash transfer does not affect daily time spent on unpaid care work
- Cash transfer also affects grade progression, though impact does not operate equally for boys and girls
- Boys and girls performing unpaid care work are more likely to drop out and follow irregular school paths
- Benefit of the treatment on timely grade progression halved for girls overburdened by unpaid care tasks
- As a result of the treatment, girls doing unpaid care work are staying in school more but not progressing
